Dietaly Data

Strontium-90 and Cesium-137 in Standard Diet

(National Institute of Radiological Sciences)

Since May 1966, National Institute of Radiological Sciences has conducted analyses of individual foodstuff samples from four prefectures (Hokkaido, Niigata, Tokyo and Kagoshima). The sampling locations are shown in Figure 1.

Individual foodstuffs produced in each prefecture were collected separately according to nine categories: cereals, beans, potatos, milk, eggs, meat, fish and shellfish, leafy vegetables and root vegetables.

The standard diet, taken in this study, was based

on the following diet components, indicated by Resource Council, Science and Technology Agency, in 1964: cereals: 422g, beans: 35g, potatos: 85g, milk: 180g, eggs: 30g, meat: 30g, fish and shellfish: 75g, leafy vegetables: 144g, root vegetables: 96g.

Collected foodstuffs were ashed and analyzed separately.

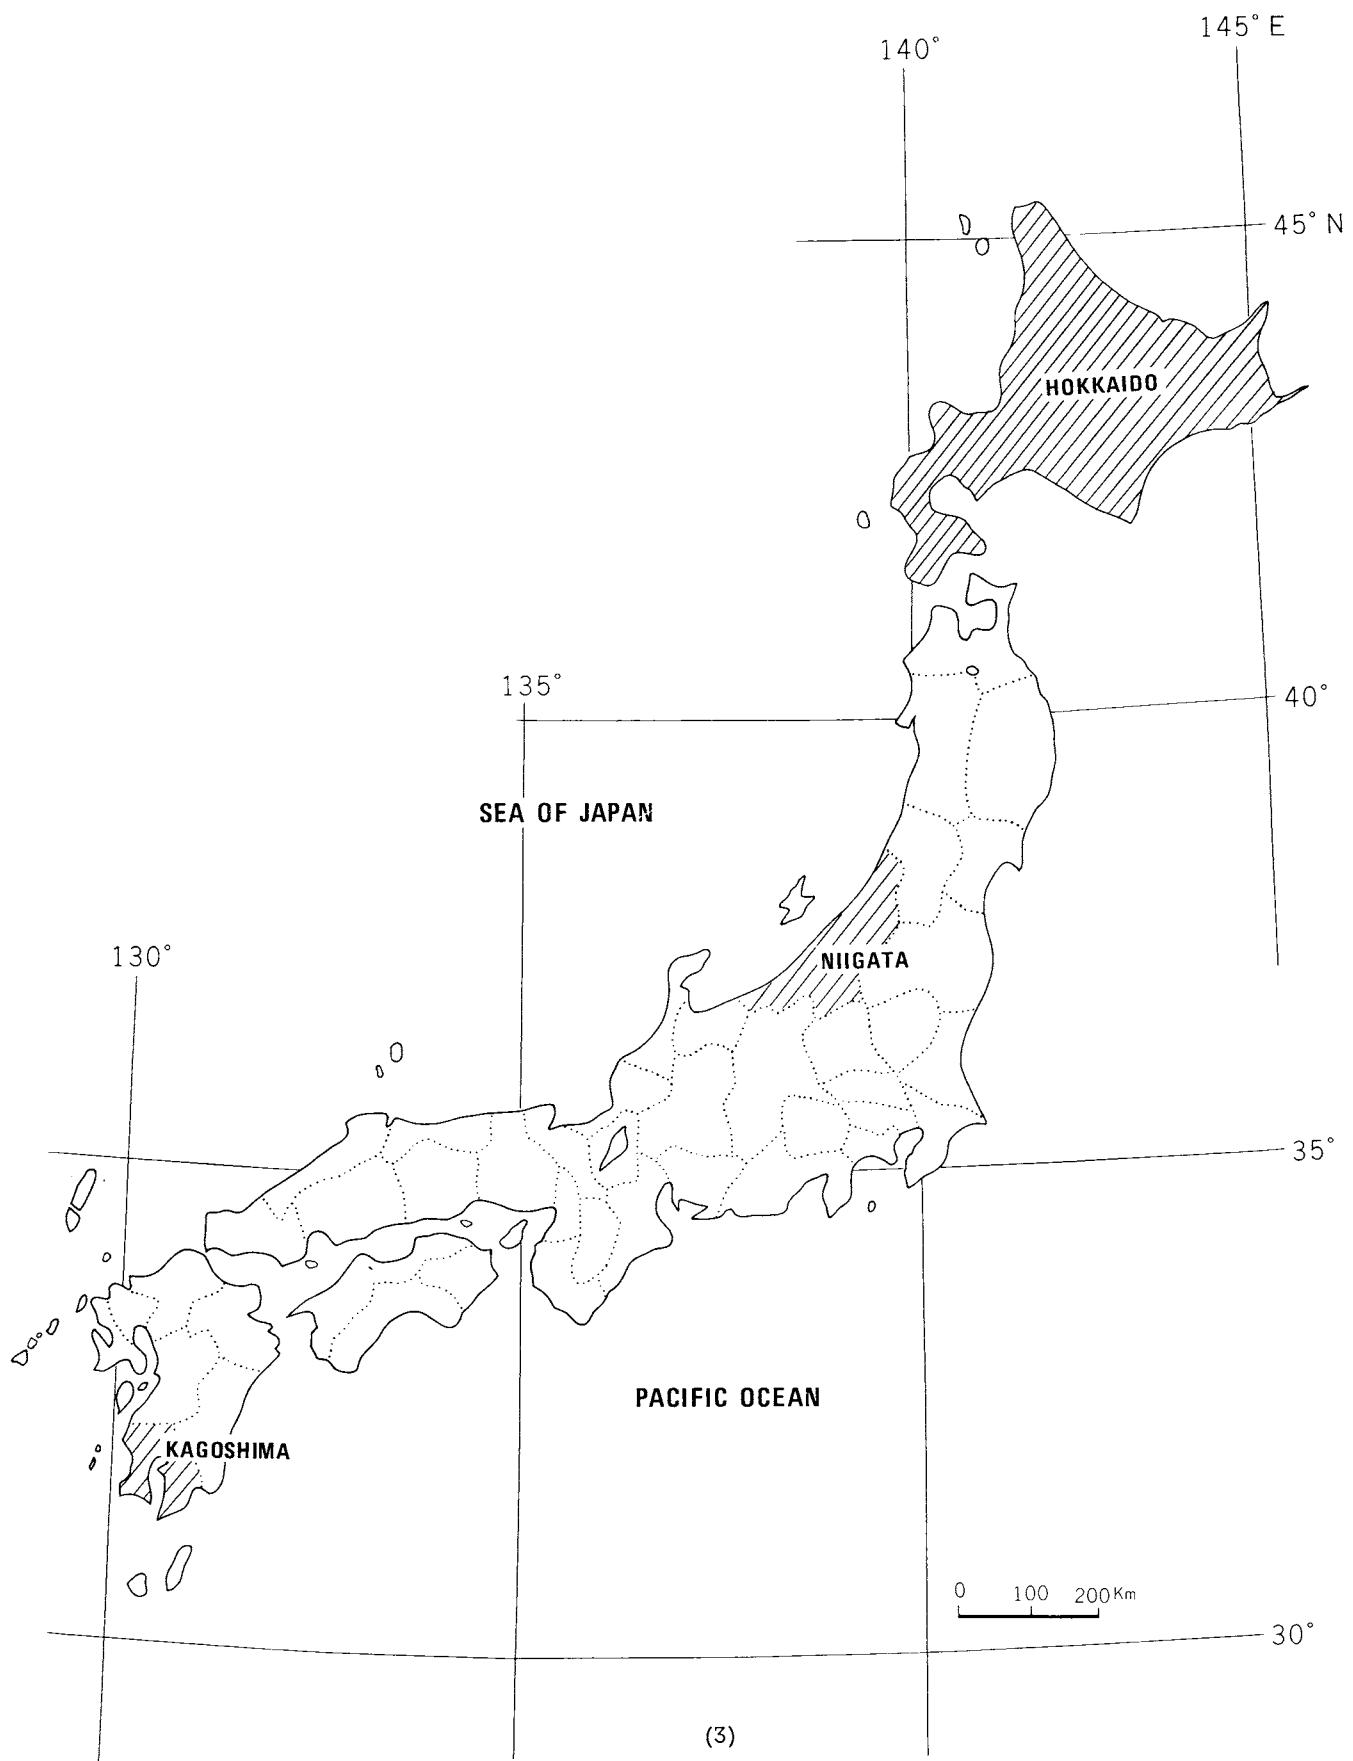

Results obtained during the period May to November, 1971 are shown in Table 1.

Figure 1 Sampling Locations of Standard Diet

Strontium-90 and Cesium-137 in Total Diet

(National Institute of Radiological Sciences)

Since June 1963, National Institute of Radiological Sciences has conducted analyses of total diet samples collected from 8 prefectures. Sampling locations are shown in Figure 2.

One city and one village in each prefecture were chosen as representative of urban and rural district of these prefectures respectively. Seven families were

chosen at random from each location, and each family presented a normal portion of the regular diet consumed in one day by an adult, diets at special occasions were avoided. Composite samples from the 5 families were ashed together and analyzed.

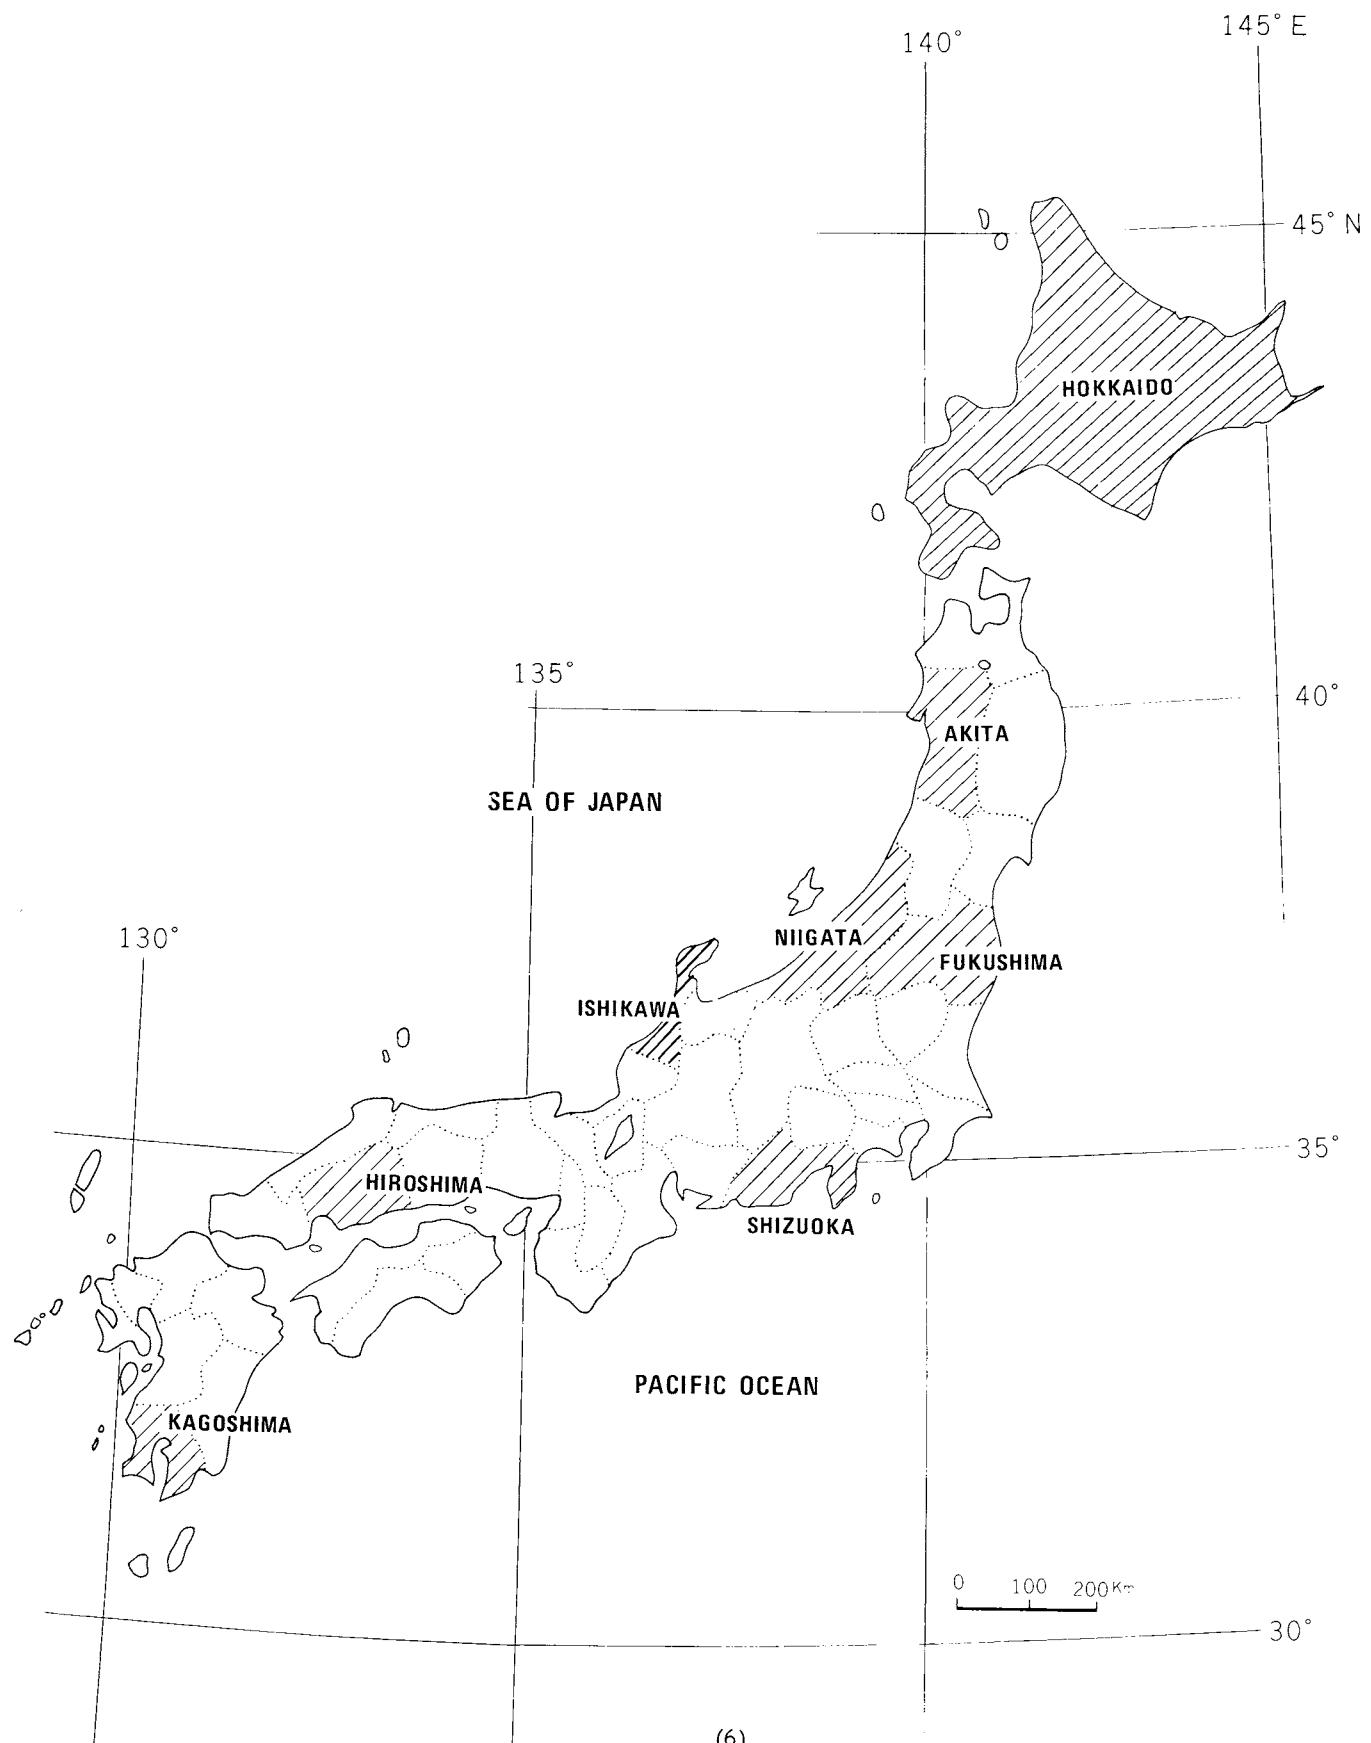

Results obtained during the period from June to November, 1971 are shown in Table 2.

Figure 2 Sampling Locations of Total Diet

Strontium-90 and Cesium-137 in Total Diet

(The Japan Analytical Chemistry Research Institute)

Since June 1963, the Japan Analytical Chemistry Research Institute has conducted analyses of Total Diet samples from the 28 prefectures shown in Figure 3.

One city and One village in each prefecture were chosen as representative of urban and rural districts of these prefectures, respectively. Five families from each

location presented a normal portion of the regular diet consumed in one day by an adult or a child.

Diets at special occasions were avoided.

Composite samples from the 5 families were ashed together and analyzed using the method recommended by the Science and Technology Agency.

Results obtained during the period from May to December, 1971 are shown in Table 3.

(collected by local Institute of Public Health)

Marine Data

Radioactivity in Marine Products, Sea Water and Bottom of the Sea Soil

(The Japan Analytical Chemistry Research Institute)

Radiochemical analysis of marine samples such as sea water, bottom of the sea soil, marine fishes, shells and sea weeds have been carried out at the Japan Analytical Chemistry Research Institute.

Sampling were performed by each local Institute of Public Health, and these stations are shown in

Figure 4, 5, 6, 7 and 8.

These samples were sent to the Japan Analytical Chemistry Research Institute and analyzed for strontium-90 and cesium-137 content, using the method recommended by the Science and Technology Agency.

Results obtained during the period from May 1971 to March 1972, are shown in Table 4, 5, 6, 7 and 8.

The Concentrations of Strontium-90 and Cesium-137 in Marine Organisms

(National Institute of Radiological Sciences)

Since November 1963, radiochemical analysis of Strontium-90 and Cesium-137 in marine organisms have carried out at National Institute of Radiological Sciences.

Samples used were collected from adjacent sea of Japan through several prefectural public health laboratories once or twice a year, and ashed at 450°C in an electric muffle furnace.

Strontium-90 was analyzed by fuming nitric acid method and was counted in form of Y-oxalate. Cesium-137 was separated by use of AMP and was measured in form of chloroplatinate.

The results in 1971 were shown in Table 9, 10 and 11.

Sampling locations of these were shown in Figure 9.
